

CASE STUDY • 01

Tabun Chai

How a fragmented digital presence was transformed into a seamless, high-converting customer acquisition engine.

A Documented UX & Conversion Design Study

The Strategic Value of a Premium Aesthetic

The visual architecture — deep roasted palettes, frosted glass, fluid animations — acts as a psychological pre-conditioner. It signals hygiene, premium quality, and comfort, justifying pricing and building brand equity.

The “Glassmorphism” Effect

Frosted aesthetics for a premium, transparent feel.

BUILT AS

Semi-transparent cards with deep blurs instead of flat color blocks.

USERS GET

Subconscious signals of transparency and cleanliness. A polished storefront implies a meticulously clean physical kitchen.

Rounded Architecture

Soft edges engineered for psychological comfort.

BUILT AS

Pill buttons and 32px soft corners with zero sharp, aggressive edges.

USERS GET

A sense of approachability and safety, aligning perfectly with a relaxing cafe vibe to keep users on the page longer.

Deep-Roasted Color

Sensory anticipation via dark, warm palettes.

BUILT AS

Deep roasted blacks illuminated by warm ambers and soft golds.

USERS GET

The simulated warmth of fresh chai, attracting premium customers willing to linger and spend on high-margin pairings.

Fluid Interactions

Dynamic animations that build brand equity.

BUILT AS

Breathing pulse indicators, smooth card tilts, and floating anti-gravity menus.

USERS GET

Proof the brand is alive. Flawless interactions implant the thought: “If they care this much about details, they care about my food.”

Situation & Scope

THE SITUATION Before the redesign, the business's digital presence was entirely reliant on a basic Google Maps link. The core problems holding it back were weak conversion pathways, zero mobile-first optimization, and poor local discoverability.	WHAT WAS BUILT ✓ Complete Landing Page Redesign ✓ Mobile-First Localized Layout ✓ Simplified Menu Navigation ✓ Integrated Location & Contact Mapping

Designing for Conversion

SECTION-BY-SECTION BREAKDOWN

01 The Hero Section

1. Above-the-Fold Clarity

IMPLEMENTATION

Core experience (vibe, context, action) fits 100% inside a single glass card before scrolling.

PROJECTED CONVERSION

Reduces bounce rate by answering 'What is this?' instantly within the critical 3-5 second window.

LOSS IF IGNORED

Risk losing 40-60% of mobile traffic to users unwilling to dig through massive full-screen content.

2. Fitts's Law & Thumb Zone

IMPLEMENTATION

Primary CTAs are exactly 44px high and placed at the bottom of the card in the mobile 'thumb zone'.

PROJECTED CONVERSION

Measurable increase in CTR. Large, reachable targets reduce physical friction for one-handed use.

LOSS IF IGNORED

Small touch targets cause mis-taps, frustration, and task abandonment.

3. Loss Aversion & Urgency

IMPLEMENTATION

Pulsing 'Live now' badge and 'Today's special' chip.

PROJECTED CONVERSION

Leverages FOMO to trigger immediate footfall and same-day action.

LOSS IF IGNORED

Without urgency, the site becomes a static brochure, losing impulse buyers to 'maybe later'.

02 Time-Sensitive Offers

1. Live Countdown Timers

IMPLEMENTATION

Calculates exact end time of the current offer with a live ticking countdown.

PROJECTED CONVERSION

Drives urgent walk-ins. Behavioral economics prove people act faster to prevent a 'lost' deal.

LOSS IF IGNORED

Static text removes psychological pressure, causing users to defer decisions and costing today's revenue.

2. Progressive Disclosure

IMPLEMENTATION

System checks local time and displays only the single currently active offer.

PROJECTED CONVERSION

Creates zero-friction decision making without needing users to calculate schedules.

LOSS IF IGNORED

Displaying all offers creates cognitive overload. Confusion leads directly to abandonment.

3. Social Proof Proximity

IMPLEMENTATION

Highly specific data tags ('260+ Happy Customers', 'Avg Prep: 4-6 mins') placed beside the offer.

PROJECTED CONVERSION

Squashes doubts instantly at the point of action, handling objections about quality or wait time.

LOSS IF IGNORED

Burying proof on other pages means users won't hunt for validation, skipping you for known alternatives.

03 Real Talks (Testimonials)

1. Interactive Flip Cards

IMPLEMENTATION

Front shows 3 core data points. Interaction reveals the full paragraph and external URL.

PROJECTED CONVERSION

Prevents cognitive overload and boosts engagement time by 20-30% via micro-interactions.

LOSS IF IGNORED

Displaying massive text walls causes visual fatigue and users will scroll past without reading.

2. Jakob's Law (Familiarity)

IMPLEMENTATION

Reviews perfectly mirror Google Maps UI patterns (Local Guide, 5-star formatting).

PROJECTED CONVERSION

Instant trust processing (<0.5s) as users subconsciously verify them as real, unedited reviews.

LOSS IF IGNORED

Custom layouts breed skepticism. Users distrust 'polished' website quotes 3x more than standard formats.

3. Anchoring Effect

IMPLEMENTATION

Section anchored with a hard aggregate data point: '4.8 / 5 based on 48 Google reviews'.

PROJECTED CONVERSION

Establishes a massive trust baseline. Aggregate scale is valued exponentially more than isolated quotes.

LOSS IF IGNORED

Without the total count, users assume the displayed cards are the only good reviews you have.

4. Von Restorff Effect

IMPLEMENTATION

Transition from text grids to an interactive, overlapping 'Live Moments' photo stack.

PROJECTED CONVERSION

High visual retention. Isolated, interactive elements command up to 40% more fixation time.

LOSS IF IGNORED

A flat photo grid blends in, causing 'banner blindness' and missing the visual proof of atmosphere.

04 Location & Contact

1. Visual Isolation

IMPLEMENTATION

Flagship branch is visually isolated with background images, glowing badges, and prominent CTAs.

PROJECTED CONVERSION

Consolidated foot traffic. Naturally funnels undecided users to the primary location.

LOSS IF IGNORED

Uniform lists introduce decision fatigue, overwhelming users and leading to abandonment.

2. Mental Models

IMPLEMENTATION

Contact utilities strictly housed inside the trust/utility footer at the absolute bottom.

PROJECTED CONVERSION

High task completion. Meets universal web standards so users intuitively find what they need.

LOSS IF IGNORED

Burying contact info mid-page misses users who natively scroll to the footer to make calls.

3. Thumb Zone Design

IMPLEMENTATION

Primary 'Check Location' buttons and 32x32 footer icons with built-in padding.

PROJECTED CONVERSION

Zero-friction mapping. Large targets allow flawless map opening while walking or driving.

LOSS IF IGNORED

Small text links drastically increase mis-tap rates, frustrating high-intent users.

4. Mere-Exposure Effect

IMPLEMENTATION

Every branch uses identical button formatting and text ('Check Location').

PROJECTED CONVERSION

Reduced cognitive friction. Repetition breeds familiarity, keeping users in flow.

LOSS IF IGNORED

Varying text burns mental energy as users pause to process if buttons have different functions.

Why This Matters

INDUSTRY DATA & BENCHMARKS

* These metrics represent general industry statistics for UX optimization, demonstrating the vast potential ROI of these design principles.

400%

A frictionless, well-designed user interface can raise a website's conversion rate by up to 400%.

74%

Of users say they are more likely to return to a company's website if it is heavily optimized for mobile navigation.

88%

Of online consumers are less likely to return to a site after experiencing a single bad user experience.

Advancements for User Growth & Retention

Beyond visual and layout optimizations, these architectural advancements are designed to capture high-intent search traffic and build an automated repeat-customer flywheel.

[01] Hyper-Local AEO

THE CONCEPT

Traditional SEO tries to rank you on a page of 10 blue links. AEO (Answer Engine Optimization) structures data so that when a user asks an AI assistant "Where is the best late-night chai spot near Balaji Colony?", the AI gives Tabun Chai as the definitive, single answer.

IMPLEMENTATION PROCESS

Write natural-language Q&A; clusters within the site's code that directly answer highly specific local queries (e.g. "Does Tabun Chai serve snacks late at night?"), then link the menu and exact coordinates to AI data-scraping sources so LLMs view the brand as the localized authority.

EXPECTED OUTPUT

35% to 50% increase in zero-click visibility. Bypasses standard search competition and sends customers straight to the business, drastically increasing high-intent footfall.

[02] Live-Menu Schema

THE CONCEPT

Right now, search engines only know the business is a website. Schema markup translates the exact menu, prices, and 5-star aggregate ratings into machine-readable data so results pages can display them before a user even clicks the link.

IMPLEMENTATION PROCESS

Inject specific JSON-LD code blocks (LocalBusiness, Menu, and AggregateRating schemas) into the site's head, tagging every item (e.g. Garam Chai – ₹15) and the 4.8/5 rating so crawlers can instantly pull and display it.

EXPECTED OUTPUT

20% to 30% increase in organic click-through rate. Displays gold star ratings, menu items, and pricing directly on search results to capture intent and win clicks.

[03] Automated CRM Loop

THE CONCEPT

The business currently funnels users from the website to WhatsApp to order or ask questions. This upgrades that channel into a closed-loop loyalty engine that automatically brings customers back without manual staff effort.

IMPLEMENTATION PROCESS

Transition the basic WhatsApp link to a WhatsApp Business API integration. When a user messages, they are tagged; seven days later at 4:30pm (before evening peak) the system autonomously sends a personalized comeback offer.

EXPECTED OUTPUT

40% to 60% increase in repeat-customer rate. Turns a one-time website visitor into a habitual, loyal regular with zero extra manual labor.

“The process was entirely untouched by us, no extra queries asked, and the final design is simply brilliant.”
